

WP6: EXTERNAL MOBILITY EFFECTS

CENIT

Center for Innovation in Transport

WORK PACKAGE OVERVIEW

- The main objective of WP6 is to analyze the impact of intermodal terminal operations on the surrounding road network mobility
- In particular, WP6 will be focused on the definition of the traffic simulation models for the case studies of La Spezia and Melzo terminals as well as developing mechanisms to dynamically simulate external traffic networks for virtual terminals.

DELIVERABLES AND MILESTONES

	Deliverable	Ends	Risks	Milestone
`\	D6.1: Demonstrator of traffic simulation model	M18	R21: Failure in the simulation techniques and framework	
	D6.2: Demonstrator of pilot cases	M24	R22: Difficulties in calibration and validation and on collecting data from traffic demand	MS14: Launch of the simulation model
	D6.3: Assessment procedure of external costs	M30		MS15: Presentation of the simulation results of the pilot cases

Task 6.1 Simulation model setting

Task	Description of Work				
T6.1 Definition of the simulation model and data setting	 Define an input of in order to be action. Define the interference models (input/or 4. Set up the methof trucks entering function of the firm. 	data model for the EMS module lapted for any kind of terminal aces between TOS and BIM utput data) odology to estimate the number g/leaving the terminal as a reight terminal demand will be integrated in the model			
T6.2 Calibration and va	alidation	Starts in M18			
T6.3 Assessment of ex	ternal mobility	Starts in M24			

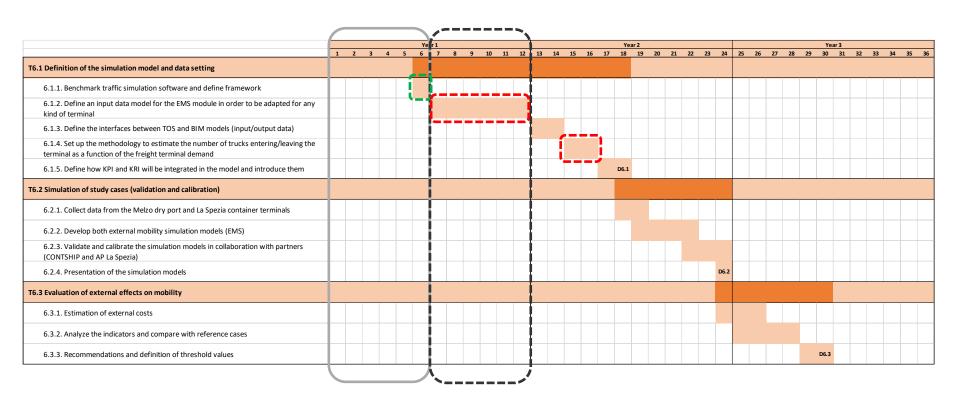

ESTIMATED PLANNING

Task 6.1.2 and Task 6.1.4

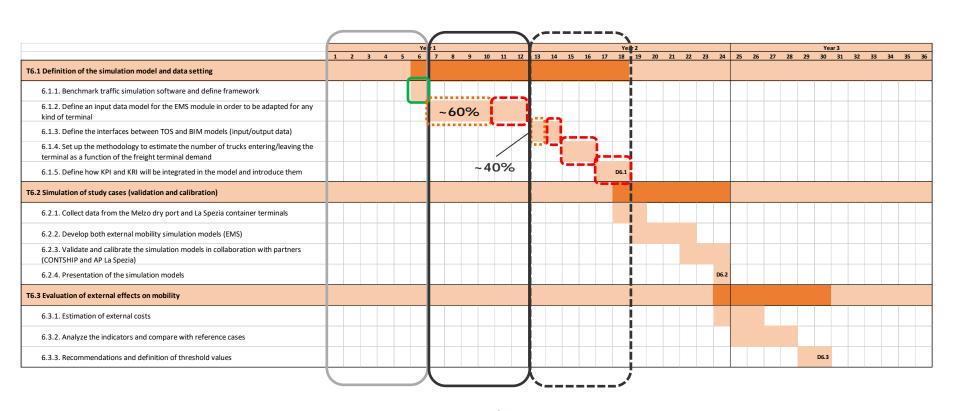

2nd 6-month period

Completion of pending tasks for D6.1

3rd 6-month period

Task 6.1.2 and Task 6.1.3

Task	Description of Work					
Task 6.1.2	 Test of configuration of traffic simulation environment (definition of parameters and programming scripts) and integration with interfaces defined in 6.1.3: Initial time of simulation Duration of simulation Distribution of trucks that enter the Terminal between existing entrances by means of a two lists (*): {(%, id), (%, id)} where % is the percentage of trucks that enter to the network using the section id 					
	(*): this information is necessary unless trucks generated by TOS know the id of the section that they must use to enter the network (See Task 6.1.3)					

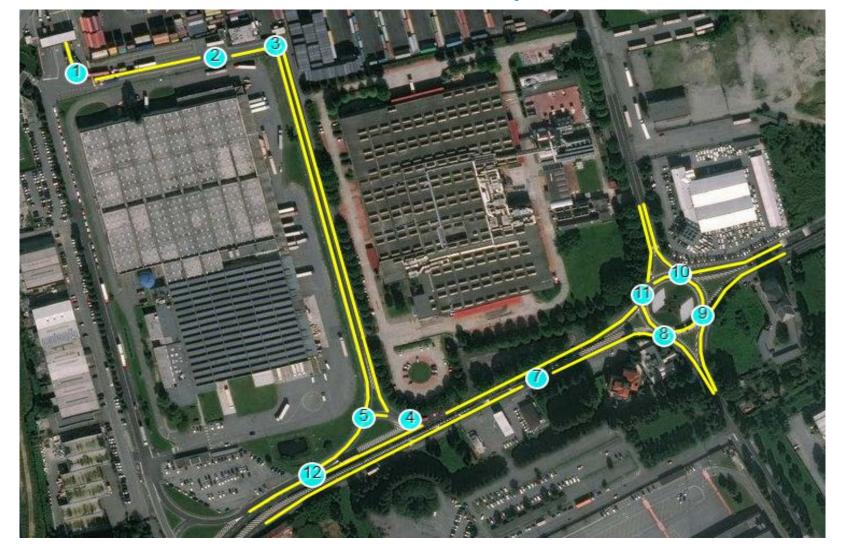

Task 6.1.2 and Task 6.1.3

Task	Description of Work						
	 Definition of input data coming <u>from</u> external components (BIM and TOS): 						
Took (1 2	 Creation of Aimsun objects representing sections and definition of turns from a SHP file. Turn refinement ["Lanes used per turn" refinement] 						
Task 6.1.3	• Identification of required information by means of a sequence of:						
	 Elapsed time: Time in minutes from simulation start 						
	 {F, T}: From or To the Terminal 						
	 [Id: Section identifier used to enter the network (* see Task 6.1.2)] 						

Task 6.1.3 (Example 1/3)

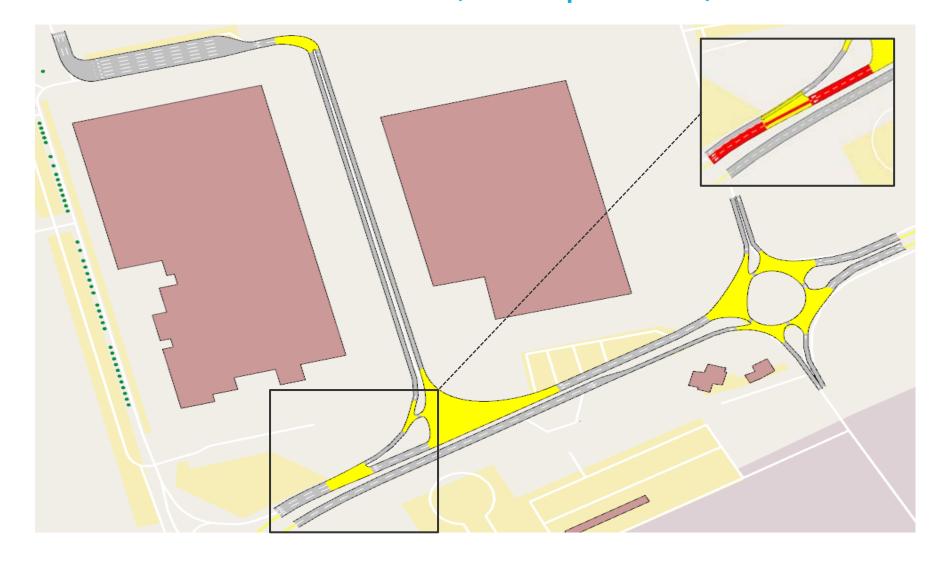

Task 6.1.3 (Example 2/3)

Task 6.1.3 (Example 3/3)

WHAT'S NEXT?

Task	Description of Work					
Task 6.1.2	 Definition of private demand: Turns / node: % of vehicles that take a specific turn for each existing node ADF: Average Daily Flow for each entrance section Completion of non-private demand: Turns / node: % of trucks that take a specific turn for each node ADF (not needed since the number of trucks are already given by TOS simulation) Additional information related to the infrastructure: Traffic signals 					
Task 6.1.3	 End testing (using real files) and refinement 					
Task 6.1.4	 Develop first approach of the methodology (already discussed internally: convergent iterative simulations previous to the "good-one" simulation) 					
Task 6.1.5 • Export results as needed						

WHAT CENIT EXPECTS FROM INVOLVED PARTNERS? SINTERMODEL

Partner	Main role / tasks / work to carry out			
MACOMI BV	 Task 6.1.3: Provide truck demand files as required Task 6.1.4: Discussion and support about methodology 			
AP SPEZIA	 Task 6.1.2: Provide information of traffic states for road networks surrounding real Terminals: % turns per node (private and trucks), Average Daily 			
CONTSHIP IT	Flow, Traffic signaling (cycle length, green/red phases, turns involved) and also distribution of trucks
